

About Us

We are a multi-exited team seasoned in deep tech & digital GTM

We are product-oriented **serial entrepreneurs and operators**, who have worked together for decades. We **successfully exited our last 3 startups @ 5-50x+ exit to entry val.**

Our companies pioneered **engagement based web software** (social, location-based), and **spatial AI & hardware** (digital twins for 3d printing and self-driving).

We've also held **senior positions with leading corporates** like Disney, Toyota, Coca-Cola & Dolby.

Machine intelligence is incomplete without understanding people.

Vy is building the world's most comprehensive model for understanding human emotion and behavior from video.

Pilot Demo

Insight

Action

Interaction

On demand analysis of customer interaction

Without Vy

Understanding through attrition, lost sales, and guesswork

With Vy

Direct data driven cause-and-effect, reactions tied to relevant data

Example

Oakland Ballers used Vy to show sponsorships work and increase prices

Real-time response to behavior in any context

Without Vy

Reliance on notice and respond

With Vy

Leverage behavior to trigger alerts and interact with applications/agents

Example

MGM exploring Vy to track line fatigue and alert guest services

Key component of understanding human behavior in AI ecosystems

Without Vy

Agents employ one off strategies for understanding users and behavior on video

With Vy

Consistent deep analysis of behavior to ensure positive interactions and informed responses

Example

OpenClaw skill to use Vy to enable non-verbal interaction and feedback

Input

Our focus on behavior allows us to source training data more contextually rather than ocean boiling.

We prioritize partnerships that maximize building value as well as revenue.

Output

What Are the Real-World Applications of World Foundation Models?

World models, when used with 3D simulators, serve as virtual environments to safely streamline and scale training for autonomous machines. With the ability to generate, curate, and encode video data, developers can better train autonomous machines to sense, perceive, and interact with dynamic surroundings.

Autonomous Vehicles

WFMs bring significant benefits to every stage of the autonomous vehicle (AV) pipeline. With pre-labeled, encoded video data, developers can curate and train the AV stack to recognize the behavior of vehicles, pedestrians, and objects more accurately. These models can also generate new scenarios, such as different traffic patterns, road conditions, weather, and lighting, to fill training gaps and expand testing coverage. They can also create predictive video simulations based on text and visual inputs, accelerating virtual training and testing.

Robotics

WFMs generate photorealistic synthetic data and predictive world states to help robots develop spatial intelligence. Using virtual simulations powered by physical simulators, these models let robots practice tasks safely and efficiently, accelerating learning through rapid testing and training. They help robots adapt to new situations by learning from diverse data and experiences.

Modified world models enhance planning by simulating object interactions, predicting human behavior, and guiding robots to reach goals accurately. They also enhance decision-making by conducting multiple simulations and learning from the feedback. With virtual simulations, developers can reduce real-world testing risks, cutting time, costs, and resources.

Video Analytics

Trained with rich, multimodal data and advanced reasoning capabilities, WFMs can perform complex video analytics on massive amounts of recorded and live videos. These models enable natural language Q&A, automated summarization, object detection, event localization, and richer contextual understanding of visual content in videos—capabilities that surpass traditional computer vision methods.

Common applications of WFMs for video analytics are found in both industrial and smart-city settings to improve safety and operational efficiency. Examples include identifying injury risks and unsafe behaviors for industrial safety, providing a detailed cause-and-effect understanding for rapid incident investigation, monitoring traffic, crowd flows, public safety incidents, and environmental hazards in smart cities, and identifying defects and irregularities on manufacturing lines through visual inspection for quality control.

Humanoid Robots will have the highest impact in these 7 areas:

1. **Domestic Assistance:** Supporting mobility needs, handling household chores, and providing medication reminders.
2. **Manufacturing:** Assisting assembly tasks, moving tools and parts, inspecting finished products.
3. **Security & Monitoring:** Patrolling facilities, investigating alerts, and assisting in emergencies.
4. **Customer Service & Reception:** Greeting and directing visitors, answering questions, and managing check-ins or bookings.
5. **Facility Maintenance:** Conducting routine inspections, performing minor repairs, cleaning, and sanitizing spaces.
6. **Healthcare:** Assisting nurses, delivering supplies or meals, monitoring patients.
7. **Warehouse and Logistics:** Picking and packing items, loading and unloading goods, and moving inventory in warehouses.
